Big picture:
- How Electron Spin Makes Matter Possible
-Quantum ArRAYs can be utilized to transform the matrix into a unitary state, one challenge at a time.

When to use/avoid Arrays:

-Once these elements have been quantumdosed, they can dance within a given array.
-The double pivot, or 360* rotation would be ideal in order to sort through these different elements, once played within the array.

When to avoid:

When the elements are not on the same page, and the elements have not been converted to a quantum equivalent of a “postfix” conversion. This would potentially cause a non sparse matrix.

** need to insert technical physics language **
** transform quantumdose into a technical physics concept**

Applications:

-Fit these arrays one at a time into loading up the quantum rubik's cube, and grow once the cube is in a unitary state.
-Could apps such as Meta utilize their interoperability to facilitate interconnectedness across members?
    - I wonder if Zuckerberg would like his Quantum Array shaken or stirred, or perhaps both for optimal array diversification?…
-Could groups such as the political parties diversify and mix their viewpoints? Should topics be so polarized, but rather could there be a coalesce of the two viewpoints?

Potential sample code idea:

```
import meta
import physics nerds
import socrates
from meta import zuck
from meta import political parties
from zuck import zuckssocks
from zuck import pleasehelpmeisuckatcoding
# any other suggestions
```

The 360* rotation:

- Rotate(political parties)
- Rotate(meta)

Transforming elements:

```
        # note here that e should be equivalent to element
e = quantumdosed element #please help here physics nerds
R = Republicans
D = Democrats

if eR and eD = = quantumdosed
        then print('Zuck it is your turn!')
else
        print('Zuck be patient with elements.')
if 'else'
        then print('Insert socratic questioning.')
```

Extrapolate this to a larger scale, and clean up code. Thank you

---

Questions/Research/Thoughts

-Max stack size?
-Is there a storage limitation, or should there be a hazard of maximum size to a given cube?
-This is open ended code, feel free to apply your quantum imagination!
-Feedback, please! My average email sitting in my inbox is 0.
