---

Prevention:

Have a stable and core central app that is working 24/7 to protect data and rights. This prevents scammers from trying to enter your crypto-space. They might try and trick you and enter your reserved space, but really this is done for selfish reasons.

---

Why?

Companies can cut costs and be profitable by training their employees to data scrape on open ended data (against user knowledge), which is unethical in my opinion. Also, companies are fully conscious of this and claim that they only “organize data networks”.

Yes, improving google's products indeed.

This methodology should probably be dumped.
