

Big picture:

-  INCREDIBLE BEDROOM AND SPACE SAVING FURNITURE FOR SMALL SPACES
-  INVENTIONS OF THE FUTURE THAT WILL SOON BE AVAILABLE TO EVERYONE
- INVENTIONS OF THE FUTURE HOME THAT WILL SOON BE AVAILABLE TO EVERYONE
- INVENTIONS OF THE FUTURE BODY THAT WILL SOON BE AVAILABLE TO EVERYONE
-  Cleaning Home TikTok ||Cleaning The House With Technology || Home Cleaning Compila...

Why?

- Just in case people try to beat the system by over allocating income to discrepancy expenses.
- Why do people need so much stuff?
- To prevent over allocation of vertical development, which will lead to core collapse.

Applications:

- Reduce greed and over consumption by individuals.
- Focus on sympathy, altruism.
- Free to choose
- Probably a range of consumption levels, but if people start to over allocate discrepancy income just why?
 - Why are certain name-brands so expensive, what makes it that much better?
- ** turn this into more jargon language for academics**
- this one will be tweaked for awhile

Potential sample code idea:

```
import physicists
import dalai lama
import global democracy
from global democracy import fairtaxes
from global democracy import GERM #or rename, if you want
import binance
from binance import chosen universal token # that has core stability and weighed parameters
import MANGA #etc
from manga import essentialism
from manga import housecleaning
from manga import optimization
from amazon import globalization
remove anti-federalists #they were right, but now they are wrong. Globalization is here.
    # why wrong? Old centralization was dangerous, now it is imperative.
    # why different? We have tools that aid bias reduction.
```

individual = data profile # can be business or person

hydrostatic equilibrium = calculated suggested consumption level

not dying = data profiles are not physically dying.
no planet danger = planet not under danger.
ultra violence = dangers present in the world
understands = realize they probably don't need to consume as much material goods
still not understanding = not willing to reduce consumption
tech = awesome minimalistic customizable gear
energy = mit/ other tech people have some seriously cool tech in their labs that i do not even understand. I would be willing to sample it, though.

```
if individual > hydrostatic equilibrium
    then print ('Why are you putting pressure on others?')
if individual == not dying and individual == no planet danger
    then print ('Ok, I understand why you are not consuming so many material goods.')
once individuals == understands
    then print('Let's tackle global problems.')
If individual == still not understanding
    then print('Okay, then switch positions with the other individual, if you want?')
```

cleaning

```
if individual wants tech
    then individual gets tech #LIFO. I'll be last, that's fine with me. Or if someone else wants
to be last, that is probably fine too.
if individual wants energy
    then individual gets energy #LIFO. I'll be last, that's fine with me. Or if someone else
wants to be last, that is probably fine too.
if individual wants medical alleviation
    then individual gets medical alleviation #LIFO. I'll be last, that's fine with me. Or if
someone else wants to be last, that is probably fine too.
iterate with AI #exponential growth, once everyone has accessibility.
```

bottom up, then middle out

ok now you can go to space as many times as you want. maximum joyrides, no burdens.

Questions/Research/Thoughts:

Can these structures be applied to diverse data structures throughout cloud storages, too?
yep.
