

@CZ Binance you owe me for this one

Binance is probably a more diverse and global app than coinbase at the moment.

I think this should all be stored within the meta.

Here is a rough outline for an idea for cryptoessentials.

---

Convert global Health based companies to cryptos:

- Global healthcare cryptos with decentralized coins that currently exist.
- Base health tokens that provide a “base or stability health level”
  - and then health tokens that can enhance humans in different sports modes or if individuals want to tweak their base levels.

---

Food cryptos:

- Individuals can choose and customize their own foods based on cryptocurrencies.
- There can be suggestions, or individuals can create their own food items - with combining blockchains.

---

Sports based cryptos:

- Can modify, enhance, or keep current sports.
- Each token or blockchain can almost serve as a portal, where the community can do bets or whatever for different activities within the blockchain.

---

Housing based cryptos:

- Allow individuals to construct their housing at a fluid or stable level, depending on their preferences. They can convert their base + incomes in order to customize their own living spaces.
- Multiple individuals can contribute to housing crypto, if desired.

---

Income based cryptos:

- Each job has their own crypto where they pay their employees. The employee each has their own meta profile where they can receive income based on their work.
- Each profile can have multiple sources of income streams.

---

Education Cryptos:

- Brilliant
- Coursera
- Youtube
- Universities
- etc

---

Any other ideas?
