

Big Picture:

- Grow space adds and commercials that focus more on space travel
 - Create netflix shows and movies that consist of space content.
 - Have algorithms that can predict and pull people's attention to thought provoking topics consisting of space and renewable energy. Make it very trendy and cool.
 - <https://www.youtube.com/watch?v=dygiaLy24ik>
-

Reducing consumption:

- Keep increasing gas prices, a temporary hold on inflation and a “recession” may not be a bad thing with respect to focusing money. This “recession” will just mean a reduced purchasing/attention to non-essential topics.
- Encourage consumption of technological based content through renewable energy.
 - Top leading institutions need to globalize, city distribute, then spread distribution and distribute entropy goggles ASAP to grab attention, which will also encourage movement. It would be ideal if these could be globally distributed by 2023.
 - Incorporating space based video games would also be very ideal. In relation to all subjects, even in school. Win/Win Scenario.
- Promote food grown by labs (healthy and cheap) to schools. Offer school lunch both free and paid, depending on income levels. This will save money for all parties.
 - Also apply this is nursing homes to pull money and apply that, too.
- Reduce government spending as much as possible. Think at the margins and stop pampering yourselves.

Continue:

- Sending attention to institutions.
 - Building from the bottom up.
 - Collaborating.

Question/Concern:

Measures in place to verify stability? Apply continuous “stress tests” or
<https://www.istgroup.com/en/service/mechanical-stress-2/>?

In question to the past, where does one draw the line between ethical and unethical development? A country/individual that is left behind (or even trying to get ahead), will probably perform the path available to their ability to grow economically.

How much easier will it be easier to track crimes through crypto - where is it all connected through actually digital tracked nodes?

I mean, it seems as if every solid leader wants what is best for their environment. And I don't think the US has to be captain america to be the one to individually save each environment.

I'll be the first to say it. I think I was wrong here. There seems to be crypto opportunities and networks paths ideas that nobody else saw. And now LATE people want to steal/ block those creative paths? I think that is fucked up.

In regards to landlords... the best teacher is the game. Friendly competition exists for a reason. If one individual is way ahead, perhaps there is a reason for that. Especially if there was no foul-play involved.

There will be choice, once there is greater diversity and more players realize the potential to help. It is really an infinite game.
